Interest is centred here on fabric-reinforced composite laminates, which are of considerable practical interest for impact-resistant aircraft structures. During the high-velocity impact loading of composite structures, failure may occur by delamination, which is important in lower energy impacts and in failure initiation, and by in-plane ply failure which controls ultimate fracture and penetration in the structure.

The composite structures can mostly absorb impact energy by elastic deformation and through damage mechanisms. Low-velocity impact may cause different damage mechanisms and in particular barely visible ones that severely reduce the structural integrity.
