However, to ensure that a stable fluid bed is maintained, the range of particle sizes that may be used in any one reactor must be within an order of magnitude, e.g., between 0.2 and 2.0 mm. Inside the fluidized bed itself, the particles are highly mobile and this results in relatively uniform bed temperatures and good control over reactions in the bed (see Figure 1.1.13). In fast fluid bed reactors, some fine particles leave the reactor with the gas stream and gas/solid separation is used to ...

A fluidized bed is a physical phenomenon occurring when a quantity of a solid particulate substance is placed under appropriate conditions to cause a solid/fluid mixture to behave as a fluid. This is usually achieved by the introduction of pressurized fluid through the particulate medium. This results in the medium then having many properties and characteristics of normal fluids, such as the ability to free-flow under gravity, or to be pumped using fluid type technologies. The resulting phenomén

A fluidized-bed reactor (FBR) is very similar to an EBR except that the high upflow liquid velocity of 10–25 m/h is maintained in the former to allow the bed expansion by 25–30% of the settled bed volume. Thus, FBR is truly a fixed-film reactor in which the suspended solids including microbes are washed out from the reactor [11].

A fluidized bed may be defined as the bed of solid particles behaving as a fluid. It operates on the principal that when an evenly distributed air is

passed upward through a finely divided bed of solid particles at low velocity, the particles remain undisturbed, but if the velocity of air flow is steadily increased, a stage is reached when the individual particles are suspended in the air stream.
