Domain Driven Design With C

Domain-driven design (DDD) is the concept that the structure and language of software code (class names, class methods, class variables) should match the business domain. For example, if a software processes loan applications, it might have classes such as LoanApplication and Customer, and methods such as

AcceptOffer and Withdraw.

Domain-driven design - Wikipedia

Domain-Driven Design is a concept introduced by a programmer Eric Evans in 2004 in his book Domain-Driven Design: Tackling Complexity in Heart of Software. It is an approach for architecting software design by looking at software in top-down approach. Before discussing topic in detail let's try to focus some light and understand what is mean by domain in this context.

Domain-Driven Design (DDD) - GeeksforGeeks

Domain-driven design (DDD) advocates modeling based on the reality of business as

relevant to your use cases. In the context of building applications, DDD talks about problems as domains. It describes independent problem areas as Bounded Contexts (each Bounded Context correlates to a microservice), and emphasizes a common language to talk about these problems.

Domain Driven Design is all about how you model your Domain. It means each Domain class should have a direct relation to what it represents in the business domain. It is addressing either in the physical or real world. So a Customer object should be named a Customer in code - it should have the same rules as a Customer does in the real world or as close as it is possible.

Domain-Driven Design - Scott Logic

Domain Driven Design, Immutability and C++. There is a powerful and simple concept in programming that is widely underused: Immutability. Basically, an object is immutable if its state doesn't change once the object has been created. Consequently, a class is immutable if its instances are immutable. There is one important argument in favor of using immutable

objects: It dramatically simplifies concurrent programming.

Unlike MVC, domain driven design doesn't present you with a reasonable starting point for how to organize your code. In

fact, starting with DDD is pretty much the exact opposite of starting with MVC - rather than jumping right into building controllers and seeing how your models evolve, you instead have to spend a great deal of time upfront deciding what your domain should be.
