Normally, there are two types of harmonic filters are used in the power system to mitigate harmonic distortion i.e. active harmonic filter (AHF) and passive harmonics filter (APF). To achieve acceptable distortion, reduce harmonics and improve power quality use shunt harmonic filter and connected in parallel which mitigate harmonics but

practical passive filters are installed because of easy availability.

Power Quality and Harmonic Analysis. With the Harmonic Load Flow Calculation and the Frequency Sweep Calculation, the user is able to analyse the modelled network in the frequency domain. The frequency-dependent network impedance offers valuable clues about possible resonances in the network and the effectiveness of countermeasures. The harmonic load flow combines the network impedance with harmonic sources, resulting in the level of the harmonic distortion for each location in the network.
