Failure rate is the frequency with which an engineered system or component fails, expressed in failures per unit of time. It is usually denoted by the Greek letter λ and is often used in reliability engineering. The failure rate of a system usually depends on time, with the rate varying over the life cycle of the system. For example, an automobile's failure rate in its fifth year of service may be many times greater than its failure rate during its first year of service. One does not expect ...

Abstract. The UK Health and Safety Executive (HSE) requires failure rate data for the assessment of COMAH safety reports and in the implementation of its statutory functions relating to land use planning in the vicinity of major hazard sites. Many of the

existing failure rates used by HSE were derived over 20 years ago, but have been subject to periodic review to ensure that they remain appropriate for modern planning enquiries or quantified risk assessments.

Figure 3.4 shows the bathtub curve of a nonrepairable product, in which the first part shows a decreasing failure rate, known as early failure; the second part is a constant failure rate, known as random failure; and the third part is an increasing failure rate, known as wear-out failure. In general, a product's failure rate is high in the beginning operation because of early failure of components.
