The solubility product constant is the equilibrium constant for the dissolution of a solid substance into an aqueous solution. It is denoted by the symbol Ksp. The solubility product is a kind of equilibrium constant and its value depends on temperature. Ksp usually increases with an increase in temperature due to increased solubility.

Solubility Product (Ksp) - Definition, Formula ...

Increasing pressure increased solubility, but increasing temperature decreases solubility An increase in pressure and an increase in temperature in this reaction results in greater solubility. An increase in pressure results in more gas particles entering the liquid in order to decrease the partial pressure.

If the solubility product of magnesium hydroxide is 2.00 x 10-11 mol 3 dm-9 at 298 K, calculate its solubility in mol dm-3 at that temperature. The trick this time is to give the unknown solubility a symbol like x or s. I'm going to choose s, because an x looks too much like a multiplication sign. If the concentration of dissolved magnesium hydroxide is s mol dm-3, then: [Mg 2+] = s mol dm-3 [OH-] = 2s mol dm-3. Put these values into the solubility product expression, and do the sum.

This equation suggests that the product of the equilibrium concentrations of the Ag + and Cl - ions in this solution is equal to a constant. Since this constant is proportional to the solubility of the salt, it is called the solubility product equilibrium constant for the reaction, or Ksp. Ksp = [Ag +] [Cl -]

The portion of the compound that dissolves acts as a strong electrolyte, meaning that the potion that dissolves also dissociates. The amount of the compound that dissolves is governed by an equilibrium constant known as the solubility product constant (K). Here, we will study the slightly soluble salt calcium hydroxide (Ca (OH)).
