Kinetics of the iodination of acetone Lab report By Jahaira Barragan Chem 1008-476 10/06/2020 Abstract: Chemical kinetics is used to measure the rate of the reaction. Reactions can be affected by many conditions such as change in temperature, concentration over time, change in surface area, and temperature. In this experiment we found that the rate of the reaction increased if the concentration was increased and if there was a used of a catalyst.

The results agree with the established notion that the order with respect to the concentration of iodine is zero order. Introduction. Kinetics is a subfield that studies the rate and mechanism for a chemical reaction. The mechanisms are the species involved, and how many of each species are involved in a reaction.

earlier and it has been found that the reaction is zero order with respect to iodine. The overall stoichiometric equation for the iodination is:- CH 3COCH 3 + I 2 CH 3COCH 2I + HI (1) If this represented the mechanism of the reaction, the rate of reaction would be proportional to both the acetone and iodine concentrations.

Changing the type of ketone in the reaction to butanone will prevent this haloketone from being produced, however the new ketone has a different chain length and therefore there is a need to test if there is a significant difference between the rates of the reaction the iodination of propanone and the iodination of butanone.

The rate of iodination of acetone has been measured as a function of temperature in the binary solvent isobutyric acid (IBA) + water near the upper consolute point. The reaction mixture was prepared by the addition of acetone, iodine, and potassium iodide to IBA + water at its critical composition of 38.8 mass % IBA.

The rate law expression for this reaction is: rate klacetone where m, n, and p are the orders of the reaction with respect to acetone, iodide, and hydrogen ion, respectively, and k is the rate constant for the reaction. The iodination of acetone can be investigated experimentally because, iodine has color so that we can readily follow the changes in iodine concentration visually, A.

CH3COCH3 (aq) + I2 (aq) ==> CH3COCH2I(aq) + H+(aq) + I-(aq) However, the rate expression is: rate = k2[CH3COCH3 (aq)] [H+(aq)] and iodine is not in the rate expression but one of the products is! Therefore the reaction is zero order for iodine and it also zero order for bromine in the similar bromination reaction.

In this experiment we will study the kinetics of the reaction between iodine and acetone: O H+ O C + I2(aq) + HI(aq) C H3C CH3 H3C CH2I The rate of this reaction is found to depend on the concentration of the hydrogen ion (acid, HCl) as well as the concentrations of the reactants (acetone

and iodine). The rate law for this reaction is

THE IODINATION OF ACETONE - MhChem

The purpose of this experiment is to determine the rate law for the reaction of iodine with acetone. In order to determine the rate law, we will use initial rates. Since this is an iodination of acetone experiment, the initial rate would be the time it takes for the brownish color of iodine to turn clear.
