The following is a list of commonly used valve standards. Based upon the scope, each of these standards contains rules and requirements for design, pressure-temperature ratings, dimensions, tolerances, materials, nondestructive examinations, testing, and inspection and quality assurance. Compliance to these and other standards is invoked by reference to codes of construction, specifications, contracts, or regulations.

The ANSI ratings come from the ASME B 16.5 which is the flange rating code. This pressure rating changes by class (the 125, 150, 300, 600 etc), the material and the maximum working temperature. Between -29 and +38 C the pressure rating doesn't change, but after that starts to gradually fall. This fall is dependant on your material.

Valve Pressure Ratings - Valve engineering - Eng-Tips

As far as ratings, ASME B16.1 lists pressure ratings for Class 125 flanges from 50 to 200 psig depending on size, material and temperature. This two-part article explains in detail the variables that affect flange ratings, then describes how flanges are produced and the accepted methods for use and installation.

According to the ANSI/ASME B16.5 specification, there are seven flange pressure ratings: 150, 300, 400, 600, 900, 1500, and 2500. The terms "pressure rating", "class", "#", "Lb" or "Lbs" are interchangeable, i.e. they all refer to the same exact concept of pressure/temperature performance of a flange (and other equipment like valves,

fittings, etc).

Flange Pressure Rating Explained (and Charts ...

There are three relevant sets of ASME/ANSI standards for flanged valves and fittings, each of which corresponds to construction material. Gray iron flanges and fittings correspond to ASME B16.1. Ductile iron flanges and fittings correspond to ASME B16.42. Steel flanges and fittings correspond to ASME B16.5.
