In LED arrays, they can help distribute the heat, which reduces the temperature at LED junctions. Thermal management materials can either be used beneath LEDs as an interface between the PCB and the outer casing (also sometimes acting as a heat sink), or they can be used to encapsulate up to the LED surface, spreading the heat both above and below the PCB surface.

Thermal Management For LED Lighting Manufacturers ...

For heat transfer between LED sources over 15 Watt and LED coolers, it is recommended to use a high thermal conductive interface material (TIM) which will create a thermal resistance over the interface lower than 0.2K/W Currently, the most common solution is to use a phase-change material, which is applied in the form of a solid pad at room temperature, but then changes to a thick, gelatinous fluid once it rises above 45 °C.
