A Systematic Review of the Application of Functional Near ...

Functional near-infrared spectroscopy (fNIRS) is such a neuroimaging tool especially suitable to investigate the effects of physical activity/exercises on cerebral oxygenation and hemodynamics due to its capability to quantify changes in the

concentration of oxygenated hemoglobin (oxyHb) and deoxygenated hemoglobin (deoxyHb) non-invasively in the human brain.

A rapid, non-destructive, in-line method suitable for sorting green hem-fir timbers (115-mm square) based on moisture content was established by near-infrared (NIR) spectroscopy. The accuracy of NIR sorting was compared with a commercial capacitance-type moisture meter. Mixed-species samples consisting of three moisture classes were assessed in this study.

Application of near-infrared spectroscopy for moisture ...

Near-Infrared Spectroscopy Near-infrared (NIR) spectroscopy is based on molecular overtone and combination vibrations. One advantage of NIR compared to MIR is that it can typically penetrate much further into a sample. Thus, it is useful for the analysis of bulk material and requires little sample preparation.

Applications of Portable Near-Infrared Spectroscopy

Functional near infrared spectroscopy (fNIRS) is a non-invasive optical imaging technique used to monitor cerebral blood

flow (CBF) and by proxy neuronal activation. The use of NIRS in nutritional intervention studies is a relatively novel application of this technique, with only a small, but growing, number of trials published to date.
