Elliptic Curve Public Key Cryptosystems

Elliptic-curve cryptography is an approach to public-key cryptography based on the algebraic structure of elliptic curves over finite fields. ECC allows smaller keys compared to non-EC cryptography to provide equivalent security. Elliptic curves are applicable for key agreement, digital signatures, pseudo-random generators and other tasks. Indirectly, they can be used for encryption by combining the key agreement with a symmetric encryption scheme. They are also used in several integer factoriza

Elliptic Curve Public Key Cryptosystems provides an up-to-date and self-contained treatment of elliptic curve-based public key cryptology. Elliptic curve cryptosystems potentially provide equivalent security to the existing public key schemes, but with shorter key lengths. Having short key lengths means smaller bandwidth and memory requirements and can be a crucial factor in some applications, for example the design of smart card systems.

An elliptic curve over the reals is dened by (3.2) where a and b are real numbers. The graph of the elliptic curve over real numbers consists of two components if its discriminant is positive and of one component if it is negative. We now dene the group law on elliptic curves which is useful for cryptographic purposes.

Elliptic Curve Cryptography (ECC) - Concepts. The Elliptic Curve Cryptography (ECC) is modern family of public-key cryptosystems, which is based on the algebraic structures of the elliptic curves over finite fields and on the difficulty of the Elliptic Curve Discrete Logarithm Problem (ECDLP).. ECC implements all major capabilities of the asymmetric cryptosystems: encryption, signatures and ...

We discuss analogs based on elliptic curves over finite fields of public key cryptosystems which use the multiplicative group of a finite field. These elliptic curve cryptosystems may be more secure, because the analog of the discrete logarithm problem on elliptic curves is likely to be harder than the classical discrete logarithm problem, especially

in using elliptic curves for integer factorization, make it natural to study the possibility of public key cryptography based on the structure of the group of points of an elliptic curve over a large finite field. We first briefly recall the facts we need about such elliptic curves (for more details, see [4] or [5]). We then describe elliptic

This paper analyzes the KMOV public key cryptosystem, which is an elliptic curve based analogue to

RSA. It was believed that this cryptosystem is more secure against attacks without factoring such as the Hs in broadcast application. Some new attacks on KMOV are presented in this paper that show the converse.
