unfavorable to chlorine. It is the primary microbiological control agent in systems with high pH, ammonia-nitrogen contamination, or persistent slime problems. Treatment of Wastes. Chlorine dioxide is used to disinfect sewage and plant wastes. It destroys phenolics, simple cyanides and sulfides by oxidation. 3 ClO 2 solution Sodium

SODIUM CHLORITE HANDBOOK - Occidental Petroleum

Chlorine is reduced in alkaline solution by an alkali arsenite (e.g., NaAsO 2). Back-titration of excess arsenite is carried out with potassium bromate (KBrO 3). In the presence of an alkali hydroxide (e.g., NaOH), chlorine is reduced to the chloride ion by hydrogen peroxide (H 2 O 2), and the excess alkali hydroxide is back-titrated with acid.

Chlorine - Production and use | Britannica

Brine is an auxiliary agent in water softening and water purification systems involving ion exchange technology. The most common example are household dishwashers, utilizing sodium chloride in form of dishwasher salt. Brine is not involved in the purification process itself, but used for regeneration of ion-exchange resin on cyclical basis. The water being treated flows through the resin container until the resin is considered exhausted and water is purified to a desired level.

Brine - Wikipedia

The chlorine production process through the electrolysis of brine is called the chlor-alkali process. This industrial method of making chlorine uses two electrodes in a brine solution with a voltage applied between them. This process passes an electrical current through the brine and draws ions in the solution to the positive and negative terminals.
