Sobolev spaces, theory and applications

In mathematics, a Sobolev space is a vector space of functions equipped with a norm that is a combination of L_p -norms of the function together with its derivatives up to a given order. The derivatives are understood in a suitable weak sense to make the space complete, i.e. a Banach space. Intuitively, a Sobolev space is a space of functions possessing sufficiently

many derivatives for some application domain, such as partial differential equations, and equipped with a norm that measures both the

Sobolev space - Wikipedia

Sobolev spaces are a fundamental tool in the modern study of partial differential equations. In this book, Leoni takes a novel approach to the theory by looking at Sobolev spaces as the natural development of monotone, absolutely continuous, and BV functions of one variable.

The set of all continuous, linear functionals on a TVS X is called the dual of X and is denoted by X' . Under pointwise addition and scalar multiplication X' is itself a vector space: $(f + g)(x) = f(x) + g(x)$, $(cf)(x) = c f(x)$, $f, g \in X'$, $x \in X$, $c \in \mathbb{C}$. X' will be a TVS provided a suitable topology is specified for it.

Let $W^{k,p}(\mathbb{R}^n)$ denote the Sobolev space consisting of all real-valued functions on $\mathbb{R}^n$ whose first k weak derivatives are functions in L^p . Here k is a non-negative integer and $1 \leq p < \infty$. The first part of the Sobolev embedding theorem states that if $k > \ell$ and $1 \leq p < q < \infty$ are two real numbers such that
