There are three main types of steam tables that the engineer must be able to use the, (1) Saturation Tables as a function of pressure; (2) Saturation Tables as a function of temperature and (3) Superheated Steam Tables. Graphically the steam tables show the values of the outer dome on the pressure-

enthalpy diagram. The following figure shows the points that are selected for the steam tables. This figure shows the values as a function of pressure. The following figure shows the points that ...

STEAM TABLES - Chemical Engineering Faculty

In steam tables the properties of the dry steam are listed and for the wet steam the properties may be calculated from the steam tables of the dry and saturated steam. For values that are not listed exactly in the tables, the value

between two figures can be obtained by linear interpolation. Interpolation is a mathematical tool by which, depending on the interval between two variables, a value in between can be calculated. The steam table shown above is a saturated water and steam table.

On the basis of unit mass, steam can hold a significant amount of energy. It ranges from 1000 to 1250 BTU/lb which can be converted into mechanical operations as heat or using a turbine. Moreover, most of the heat content in steam is latent heat, therefore; it can be transported at the same temperature as well.
