Loop detection is an always-on feature of your switch that helps you identify and remove loops on your network. Network loops can slow down or stop normal traffic on your network. When your network has a loop, the switch is connected to itself and network traffic is looping and growing continuously instead of reaching its destination and stopping. To check for a loop in your network, check the port LEDs of your Nighthawk switch.

If the operator uses a safety loop, an incorrect loop installation may cause the detector to sense the metal of the gate or the operator and trigger the detector. Refer to the page Safety Loop Installation for details. If the operator uses a beam, vibrations from the gate moving may cause the beam to shake and briefly go out of alignment. In its most basic configuration, a phase-locked loop compares the phase of a reference signal (F REF) to the phase of an adjustable feedback signal (RF IN) F 0, as seen in Figure 1. In Figure 2 there is a negative feedback control loop operating in the frequency domain. When the comparison is in steady-state, and the output frequency and phase are matched to the incoming frequency and phase of the error detector, we say that the PLL is locked.

The loop detector plugs into the gate operator's main circuit board. The loop, a continuous length of wire, resonates at a

regular frequency. But when something big and metal rolls over the loop, the frequency increases. Once this change is detected, a relay which is usually open will close and remain closed until the car rolls off it.

You can't fix a loop in the ground, so test it last and be confident in your diagnosis. If your at home reading lamp stops working what do you do? You put a new light bulb in it to see if that fixes it. The E-Z Detector Checker does the same thing, it's a new loop (lightbulb) for your loop circuit (lamp). The E-Z Detector Checker tests the detector, and harness wiring/circuit board connection.

Inductive loop detectors are a relative cheap solution. Such a detector consists of several turns made of an insulated cable embedded directly in a saw cut slot in the road surface as presented by Gibson and Tweedy (1998). The cost of a single inductive loop along with its installation ranges from several dozens to a 100 dollars each. -

Application of inductive loops as wheel detectors ...

When the PLL, phase locked loop, is in lock a steady state error voltage is produced. By using an amplifier between the phase detector and the VCO, the actual error between the signals can be reduced to very small levels. However some voltage must always be present at the control terminal of the VCO as this is what puts onto the correct frequency.

Phase-Locked Loop Detector. The phase-locked loop detector compares the input frequency and the output frequency of the VCO to produces a DC voltage which is directly proportional to the phase distinction of the two frequencies. The analog and digital signals are used in the phase-locked loop.

Phase Locked Loop Operating Principle and Applications

At low frequencies, the error is small and is dominated by the decay of the detector capacitor between cycles. As frequency rises, the error increases because capacitor charging time decreases. During this time the overdrive becomes a very small portion of a sine wave cycle.Finally, at approximately 4MHz, the error rises rapidly owing to the slew-rate limitation of the op amp.
