Abstract. We consider bandwidth selection for the kernel estimator of conditional density with one explanatory variable. Several bandwidth selection methods are derived ranging from fast rules-of-thumb which assume the underlying densities are known to relatively slow procedures which use the bootstrap.

This paper discusses the kernel estimator of conditional density. A significant problem of kernel smoothing is bandwidth selection. The problem consists in the fact that optimal bandwidth depends on the unknown conditional and marginal density. This is the reason why some data-driven method needs to be applied.

4.3 Bandwidth selection. Bandwidth selection, as for kernel density estimation, is of key practical importance for kernel regression estimation. Several bandwidth selectors have been proposed for kernel regression by following similar plug-in and cross-validatory ideas to the ones seen in Section 4.3. For simplicity, we first briefly overview the plug-in analogues for local linear regression for a single continuous predictor.

We propose two methods to select bandwidths tailored for mode estimation in the regression setting.
