Thanks to its higher operating temperature, cuprates are now becoming competitors for more ordinary niobium -based superconductors, as well as magnesium diboride superconductors. High-temperature superconductors (abbreviated high-Tc or HTS) are operatively defined as materials that behave as superconductors at temperatures above 77 K (−196.2 °C; −321.1 °F), the boiling point of liquid nitrogen, one of the simplest coolants in cryogenics.

High-temperature superconductivity - Wikipedia

Book Description Written by eminent researchers in the field, this text describes the theory of superconductivity and superfluidity starting from liquid helium and a charged Bose-gas. It also discusses the modern bipolaron theory of strongly coupled superconductors, which explains the basic physical properties of high-temperature superconductors.

The high-temperature superconductor $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ is the first material to become superconducting above 77K, the boiling point of nitrogen. All materials developed before 1986 became superconducting only at temperatures

near the boiling points of liquid helium or liquid hydrogen ($T_b = 20.28\text{K}$)—the highest being Nb₃Ge at 23K.

High Temperature Superconductors - an overview ...

High-temperature superconductors are materials that become superconducting at temperatures well above a few kelvin. The critical temperature T_c is the temperature below which a material is superconducting. Some high-temperature superconductors have verified T_c s above 125 K, and there are reports of T_c s as high as 250 K.
