A 4-bit SISO shift register consists of 4 flip flops and only three connections. The registers which will

shift the bits to left are called “Shift left registers”. The registers which will shift the bits to right are called “Shift right registers”. Example: If we pass the data 1101 to the data input, the shifted output will be 0110.

Shift Registers - Types , Applications

This shift register design has five inputs and one n-bit output and the design is parameterized using parameter MSB to signify width of the shift register. If n is 4, then it becomes a 4-bit shift register. If n is 8, then it becomes an 8-bit shift register. This shift register has a few key features:
