The researchers surveyed the southern Gulf of Mexico, an area that had been home to the Ixtoc 1 well, which suffered a blowout and massive oil spill in 1979. Along with measuring the typical distribution of elements, the study looked for evidence of oil within the sediment that could have come from that spill, but they didn’t find any signs of that disturbance remaining.

**FSU researchers study Gulf of Mexico in international ...**

The amount of carbon dioxide in the atmosphere has increased 40 percent since the Industrial Revolution (1760 to 1840) because of human activities. The ocean, including the Gulf of Mexico, has absorbed at least 25 percent of this carbon dioxide, which will almost certainly continue to increase, resulting in harmful conditions to marine life, according to a study co-authored by a team of Texas A&M University Department of Oceanographyprofessors.
