The Molecular Biology Of Cancer

This detailed understanding of the process of carcinogenesis at the molecular level has only been possible because of the advent of modern molecular biology. This new discipline, by precisely identifying the molecular basis of the differences between normal and malignant cells, has created novel opportunities and provided the means to specifically target these modified genes.

The Molecular and Cell Biology of Cancer - I. Cancer is a group of heterogeneous genetic diseases inherent in cells that proliferate in an unregulated manner. For a disease whose molecular characterisation began as recently as in the 70s, the span of these 4 decades have proven to be an aeon vis-a-vis breakthroughs in molecular oncology. Surprisingly, cancer holds an equally strong - almost ghoulish - fascination for the the general public, who probably think of it as the boogeyman of diseases;

Abstract. Head and neck squamous cell carcinomas (HNSCCs) are caused by tobacco and alcohol consumption and by infection with high-risk types of human papillomavirus (HPV). Tumours often develop within preneoplastic fields of genetically altered cells. The persistence of these fields after treatment presents a major challenge, because it might lead to local recurrences and second primary tumours that are responsible for a large proportion of deaths.
