Acute myelogenous leukemia (AML), is the most common form of leukemia in adults. AML is a deadly form of malignancy, the prognosis for which has not improved in the last two decades. More importantly, it is a malignancy that is seen in older adults, therefore the number of cases is likely to rise as the population ages.

Abstract. Acute myeloid leukaemia (AML) is a heterogeneous clonal disorder of haemopoietic progenitor cells and the most common malignant myeloid disorder in adults. The median age at presentation for patients with AML is 70 years. In the past few years, research in molecular biology has been instrumental in deciphering the pathogenesis of the disease.

Acute Myeloid Leukemia | Cancer Genetics Web

Abstract Acute myeloid leukemia (AML), the most common acute leukemia in adults, increases exponentially with age. While a number of recent advances have improved treatment, high cure rates have not yet been achieved.

New Insights Into the Biology of Acute Myeloid Leukemia ...

Some people with acute myeloid leukemia (AML) have

one or more known risk factors, but many do not. Even when a person has one or more risk factors, it's very hard to know if it actually caused the cancer. Certain changes in the DNA in normal bone marrow cells can cause them to become leukemia cells. The DNA inside our cells makes up our genes, which control how our cells function.
