The ROC curve is a graph with: The x-axis showing $1 - \text{specificity}$ ($= \text{false positive fraction} = \text{FP} / (\text{FP} + \text{TN})$) The y-axis showing sensitivity ($= \text{true positive fraction} = \text{TP} / (\text{TP} + \text{FN})$) Thus every point on the ROC curve represents a chosen cut-off even though you cannot see this cut-off.

ROC curves - what are they and how are they used?

ROC is a probability curve and AUC represents degree or measure of separability. It tells how much model is capable of distinguishing between classes. Higher the AUC, better the model is at predicting 0s as 0s and 1s as 1s. By analogy, Higher the AUC, better the model is at distinguishing between patients with disease and no disease. The ROC curve is plotted with TPR against the FPR where TPR is on y-axis and FPR is on the x-axis.

Understanding AUC - ROC Curve - Towards Data Science

The ROC curve plots out the sensitivity and specificity for every possible decision rule cutoff between 0 and 1 for

a model. This plot tells you a few different things. A model that predicts at chance will have an ROC curve that looks like the diagonal green line. That is not a discriminating model.
