Functional magnetic resonance imaging or functional MRI (fMRI) measures brain activity by detecting changes associated with blood flow. This technique relies on the fact that cerebral blood flow and neuronal activation are coupled. When an area of the brain is in use, blood flow to that region also increases.

Functional magnetic resonance imaging (fMRI) allows the exploration of the local vascular response, and indirectly the

coupled neural response to particular stimuli. It utilizes differences in the paramagnetic properties of oxyhemoglobin and deoxyhemoglobin, known as blood oxygen level-dependent (BOLD) contrast, to generate images of cerebral activity (Ogawa and Lee, 1990).
