Fault Tolerant Control Systems Design

Fault Tolerant Control System Design. The basic purpose of a closed-loop system design is to maintain desired performance in despite of the faults in system devices and disturbances from the external environment. There are intrinsic conflicts between achievable performance and system robustness. A well thought control system design is to make some suitable trade-offs between these two specifications.

A fault-tolerant design enables a system to continue its intended operation, possibly at a reduced level, rather than failing completely, when some part of the system fails. The term is most commonly used to describe computer systems designed to continue more or less fully operational with, perhaps, a reduction in throughput or an increase in response time in the event of some partial failure.

Fault tolerance - Wikipedia

Faults in automated processes will often cause undesired reactions and shut-down of a controlled plant, and the consequences could be damage to the plant, to personnel or the environment. Fault-tolerant control is the synonym for a set of recent techniques that were developed to increase plant availability and reduce the risk of safety hazards.

What is Fault-Tolerant Control? - ScienceDirect

Early work on fault-tolerant computer systems used fault jetection and reconfiguration at the level of simple devices such as flip-flops and adders. Later work considered units such as registers or blocks of memory. With today’s LSI Inits, it is no longer appropriate to be concerned with such ;mall subunits.
