X-ray spectroscopy is an excellent method to determine the structure of a compound. In the event when other spectral methods fail to reveal a compound's identity, X-ray spectroscopy is the method of choice for structural determination where the other parameters such as bond lengths and bond angles are also determined.

Definition. Surface-sensitive X-ray photoelectron spectroscopy (XPS) is uniquely suited for determining surface chemistry and has been demonstrated as an excellent characterization tool for tribology. Specifically, it can be used to characterize tribo-boundary films via multiple approaches, including survey scanning, element mapping, binding energy shift detection, and composition depth profile generation.
