A dental curing light is a piece of dental equipment that is used

for polymerization of light cure resin based composites. It can be used on several different dental materials that are curable by light. The light used falls under the visible blue light spectrum. This light is delivered over a range of wavelengths and varies for each type of device.

Dental curing light - Wikipedia

There has been a continual advent of improved technologies in dentistry. Among these are the material sciences of resin-based composites (RBCs). Since the introduction of light-cured RBCs, the...

Argon lasers emit blue-

green light of activated argon ions in selected wavelengths (between 450 and 500 nm) and are therefore suitable for light-curing of resin-based composites.³⁴ Argon-ion lasers operating with 250 ± 50 mW/cm² for 10 seconds achieve improved curing of light-activated restorative 3

Light curing of resin-based composites in the LED era

The resin-based composites were irradiated for the times recommended by the products' manufacturers.

METHODS: The authors used a curing light adjusted to emit 300 mW/cm² in the 400-nm to 515-nm wavelength bandwidth to polymerize five samples of each

composite brand type and shade.

To determine the potential effect of four different light curing units (LCUs) on the curing profile of two bulk fill resin-based composites (RBCs). Methods Four LCUs (Bluephase 20i, Celalux 3, Elipar DeepCure-S and Valo Grand) were used to light cure two RBCs (Filtek Bulk Fill Posterior Restorative and Tetric EvoCeram Bulk Fill).

Dentists' requests for a short chair time to prepare a restoration compel a continual reduction in polymerization time for curing resin-based

composites (RBCs). When the first high-intensity visible light plasma arc curing (PAC) units were introduced in 1998, the manufacturer claimed to be able to fulfill these wishes, declaring a 3-second polymerization time as sufficient for an adequate polymerization.

Resin-based Composite Light-cured Properties Assessed by ...

This study investigates two technically simple methods to determine the irradiance distribution of light curing units that governs the performance of a visible-light curing resin-based composites. Insufficient light irradiation leads to under-cured

composites with poor mechanical properties and elution of residual monomers.

Adhesives & resins We offer a range of UV lamps and LEDs for curing and bonding applications. The choice of lamp for your particular application will depend on the spectral output required for the material you are looking to cure, minimum UV light irradiance levels and curing area.

Adhesives & resins - UV Light Technology

Hence, when using E c as light energy value, the curing depth is zero. 21 D p is the penetration depth of

the resin, that is, the depth at which the light intensity is decreased to $1/e$ of the intensity at the surface. $21-23 E_c$ and D_p are both characteristic constants of the resin. 21 Plotting C_d versus E_0 in a semilogarithmic scale (Figure S2, Supporting Information) yields a straight line with D_p as the slope m of the curve. 21 The critical energy E_c can be calculated from the y ...

Towards the GIC end of the spectrum, there is increasing fluoride release and increasing acid-base content; towards the composite resin end of the

spectrum, there is increasing light cure percentage and increased flexural strength.

Dental composite - Wikipedia

Different technologies for light curing resin based materials have been developed to overcome these problems. The first light emitting diode (LED) light curing units were introduced marketing in 2001 as an alternative to halogen lamps. LEDs are highly efficient light sources that produce light within a narrow spectral range.
