The Conformal Structure Of Space

In mathematics, conformal geometry is the study of the set of angle-preserving transformations on a space. In a real two dimensional space, conformal geometry is precisely the geometry of Riemann surfaces. In space higher than two dimensions, conformal geometry may refer either to the study of conformal transformations of what are called "flat spaces", or to the study of conformal manifolds which are Riemannian or pseudo-Riemannian manifolds with a class of metrics that are defined up to scale.

About this book. About this book. Causal relations, and with them the underlying null cone or conformal structure, form a basic ingredient in all general analytical studies of asymptotically flat space-time. The present book reviews these aspects from the analytical, geometrical and numerical points of view. Care has been taken to present the material in a way that will also be accessible to postgraduate students and nonspecialist reseachers from related fields.

Conformal structure. A conformal structure on a vector space V is a class K of pairwise-homothetic Euclidean metrics on V . Any Euclidean metric g on V defines a conformal structure, $K = \mathbf{R}^+ g = \{ \lambda g : \lambda > 0 \}$, called the conformal structure induced by the Euclidean metric g .

In theoretical physics, a Penrose diagram (named after mathematical physicist Roger Penrose) is a two-dimensional diagram capturing the causal relations between different points in spacetime through a conformal treatment of infinity. It is an extension of a Minkowski diagram where the vertical dimension represents time, and the horizontal dimension represents a space dimension, and slanted lines at an angle of 45° correspond to light rays ($c = 1$).
