The most common photochemical process on Earth is photosynthesis. Life on Earth mainly depends on the process of photosynthesis. In this process, plants can convert the energy from sunlight into stored chemical energy via forming carbohydrates (using carbon dioxide and water from the atmosphere). Also, this process releases oxygen to the atmosphere.

The photobiological hydrogen production process uses microorganisms and sunlight to turn water, and sometimes organic matter, into hydrogen. This is a longer-term technology pathway in the early stages of research that has a long-term potential for sustainable hydrogen production with low environmental impact.
