Underwater Optical Wireless Communication (UOWC) is not a new idea, but it has recently attracted renewed interest since seawater presents a reduced absorption window for blue-green light. Due to its higher bandwidth, underwater optical wireless communications can support higher data rates at low latency levels compared to acoustic and RF counterparts.

Underwater Optical Wireless

Communications: Overview

The technologies are much different, but each has its place, its strengths, and its weaknesses. Wireless communications relies on the transmission and reception of RF/microwave signals modulated with the information to be carried while optical communications uses modulated light beamed through fiber-optic cables.

What's the Difference Between Optical and Wireless ...

Optical wireless communications (OWC) is a form of optical communication in which unguided visible, infrared (IR), or ultraviolet (UV) light is used to carry a signal. OWC systems operating in the visible band (390–750 nm) are commonly referred to as visible light communication (VLC). VLC systems take

advantage of light emitting diodes (LEDs) which can be pulsed at very high speeds without noticeable effect on the lighting output and human eye.

Optical wireless communications - Wikipedia

Optical wireless communications (OWC) has witnessed a revival recently among researchers in both academia and industry. The main reason for this resurgence is the exhausted radio-frequency (RF) spectrum, which is getting too crowded to handle the increasingly high demand for data rates. The optical band offers an opportunity to relieve the RF spectrum by accommodating part of the load.
