And a pedigree is a way of analyzing the inheritance patterns of a trait within a family. And it can be useful to understand more about that trait, maybe to make some insights about the genetics of that trait, and it's a way to think about what's happened in the past in a family, and then maybe we can help get some probabilities or get some understanding of what might happen in the future.

A pedigree is a representation of our family tree. It shows how individuals within a family are related to each other. We can also indicate which individuals have a particular trait or genetic condition. If we take a pedigree, which we usually try to include at least three generations, we might be able to determine how a particular trait is inherited.

This worksheet gives students a chance to practice identifying genotypes on pedigree charts. The pedigrees focus on human genetic diseases, such as albinism, cystic fibrosis, tay-sachs, and sickle cell anemia. Some students do struggle with these charts, so I usually practice doing a few with them. If the parents are both heterozygous (Aa x Aa) many students will be confused about the genotype of an offspring who does not have the disease.

Some students will have an easy time with pedigrees, depending on how well they understood genetic crosses. In this activity, students are introduced to the concept of a pedigree of a family and they practice determining the genotypes of family members based on observed recessive phenotypes.
