many approximations and assumptions are made in the design of bolted and welded connection. Following are the requirements of a good connection in steelwork: 1) It should be rigid, to avoid fluctuating stresses which may cause fatigue failure. 2) It should be such that there is the least possible weakening of the parts to be joined.

When welded or bolted connections are designed, or when the structure is analysed together with the joints, the program carries out, at each node of the job, the spatial layout of the bars and its fixity conditions in such a way that, for steel bars, the dimensions of the nodes are established and generates the rigid ends in which the portions of the bars are considered to not deform due to them being contained within the node.
