Let us consider in detail the principle of bit-interleaved coded modulation (BICM) in the MIMO context. At the transmitter, a frame of information bits is first encoded by a convolutional encoder, and then interleaved by a random permutation. The frame of

interleaved coded bits is then split into n sub-blocks. Within each sub-blocks, the bits are mapped to one complex symbol in a multilevel/phase constellation.

Bit-interleaved coded modulation. Abstract: It has been recognized by Zehavi (1992) that the performance of coded modulation over a Rayleigh fading channel can be improved by bit-wise interleaving at the encoder output, and by using an appropriate soft-decision metric as an input to a Viterbi (1990) decoder. The paper presents in a comprehensive fashion the theory underlying bit-interleaved coded modulation, provides tools for evaluating its performance, and gives guidelines for its design.
