The book aims to initiate a rigorous mathematical study of the immiscible flow models, partly by using the novel 'global pressure' approach in treating incompressible two-phase problems. A finite element approximation technique based on the global pressure variational model is presented, and new approaches to the modelling of various kinds of multiphase flow through porous media are introduced.

The solution to the numerical model equations are, in turn, an approximation of the real solution to the PDEs. The finite element method (FEM) is used to compute such approximations. Take, for example, a function u that may be the dependent variable in a PDE (i.e., temperature, electric potential, pressure, etc.)

Mathematical modeling and finite element analysis have been widely used for the investigation of the biomechanics of the spine, and are considered to be one of the pillars of spine research together with in vitro testing and in vivo studies. Hundreds of finite element models aimed at predicting the biomechanical response of the spine under both healthy and pathological conditions as well as after the implantation of surgical devices have been discussed in the literature.

Finite element, finite volume, finite difference and spectral methods have all been used in modeling mantle convection, and almost every model used an Eulerian grid. Due to the simplicity and speed of the finite-difference and spectral methods, they were used in some early models, but finite-element or finite volume methods were generally adopted in the 2010s. However, in their last step they became so close to the traditional finite elements that we decided to use a different perspective and a different name. Now the virtual element spaces are just like the usual finite element spaces with the addition of suitable non-polynomial functions. This is far from being a new idea.

Finite model theory (FMT) is the subarea of model theory (MT) that deals with its restriction to interpretations on finite structures, which have a finite universe. Since many central theorems of model theory do not hold when restricted to finite structures, FMT is quite different from MT in its methods of proof.
