Vector Quantization And Signal Compression

In the 1980s vector coding or vector quantization has come of age and made an impact on the technology of signal compression. Several commercial products for speech and video coding have emerged which are based on vector coding ideas.

VECTOR QUANTIZATION AND SIGNAL COMPRESSION

Compression in general is intended to provide efficient representations of data while preserving the essential information contained in the data. This book is devoted to the theory and practice of signal compression, i. e. , data compression applied to signals such as speech, audio, images, and video signals (excluding other data types such as financial data or general purpose computer data).

Vector quantization and signal compression | Guide books

Vector quantization is a classical quantization technique from signal processing that allows the modeling of probability density functions by the distribution of prototype vectors. It was originally used for data compression. It works by dividing a large set of points into groups having approximately the same number of points closest to them. Each group is represented by its centroid point, as in k-means and some other clustering algorithms. The density matching property of vector quantization i

Vector quantization (VQ) is a kind of signal compression method. CELP coding uses the VQ method to compress data, such as an excitation signal, LPCs, and codebook gain. VQ concerns the mapping in a multidimensional space from a (possibly continuous-amplitude) source ensemble to a discrete ensemble.

5.2.3 Vector Quantization. Vector quantization is a lossy compression technique used in speech and image coding. In scalar quantization, a scalar value is selected from a finite list of possible values to represent a sample. In vector quantization, a vector is selected from a finite list of possible vectors to represent an input vector of samples. The key operation in a vector quantization is the quantization of a random vector by encoding it as a binary codeword.

Abstract: A vector quantizer is a system for mapping a sequence of continuous or discrete vectors into a digital sequence suitable for communication over or storage in a digital channel. The goal of such a system is data compression: to reduce the bit rate so as to minimize communication channel capacity or digital storage memory requirements while maintaining the necessary fidelity of the data.

We can do the same with quantization. The vector quantization procedure is shown in this block diagram. It is a rather straight forward procedure. Given a one dimensional or a two dimensional signal, such as an image, a number of samples or pixels in a small block are considered at once and they are grouped into a vector.
