Imaging of Cerebrovascular Disease: A Practical Guide is written both to be read

from cover to cover and to be used as a quick reference in the midst of a busy clinical day. It serves well as a supplement to general introductory neuroradiology texts, advancing the reader's expertise regarding ischemia, aneurysms, vascular malformations, and other vascular lesions.

Yet, luminal imaging has limitations as cerebrovascular disease often arises not from the lumen, but from the vessel wall. 2 Intracranial blood vessel wall magnetic resonance imaging (MRI) has emerged as an adjunct to luminal imaging, and this technique is increasingly used on a clinical basis at many centers. 3 An important consequence of cerebrovascular disease is alteration of perfusion at the tissue level, and there are a range of options for assessing hemodynamics at the tissue level as ...

Optimal diagnosis and characterization of cerebrovascular disease requires selection of the appropriate imaging exam for each clinical situation. In this review, we focus on intracranial arterial disease and discuss the techniques in current clinical use for imaging the blood vessel lumen and blood vessel wall, and for mapping cerebral hemodynamic impairment at the tissue level.

Abstract. Imaging inflammation in large intracranial artery pathology may play an important role in the diagnosis of and risk stratification for a variety of cerebrovascular diseases. Looking beyond the lumen has already generated widespread excitement in the stroke community, and the potential to unveil molecular processes in the vessel wall is a natural evolution to develop a more comprehensive understanding of the pathogenesis of diseases, such as ICAD and brain aneurysms.

Imaging Inflammation in Cerebrovascular Disease

Intracranial high-resolution MR vessel wall imaging (VWI) has emerged as an invaluable technique for understanding and evaluating cerebrovascular diseases. The location and pattern of contrast enhancement in intracranial

VWI provides new insight into the inflammatory etiology of cerebrovascular diseases and has potential to permit earlier diagnosis and treatment.

Studies have evaluated the population prevalence of CVD with brain magnetic resonance imaging (MRI),^{3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13} yet different types of cerebrovascular brain lesions (ie, infarctions, cerebral microbleeds [CMBs], and white-matter hyperintensities [WMHs]) have been reported independently. Report of the population prevalence of all types of CVD lesions in a single study provides improved understanding of the frequency of vascular brain disease in the aging population.

Imaging of Cerebrovascular Disease ; Vascular diseases of the brain constitute a rather broad category, but consist primarily of aneurysms, arteriovenous (AV) malformations and stroke. Aneurysms and AV malformations will be discussed under the topic of intra cranial hemorrhage and then we will review imaging of stroke.

IMAGING OF CEREBROVASCULAR DISEASE - UCSD

Although our review is mostly focused on noninvasive vessel wall imaging techniques, advances in catheter-based technology for the minimally invasive treatment of cerebrovascular disease is also enabling the development of high-resolution intravascular imaging technology. 35 – 37 Albeit invasive, with resolution approaching microscopy, these technologies have secured an important role in characterization of lesions in the peripheral and coronary circulations to support endovascular treatments.

Magnetic resonance imaging (MRI) has established itself as the method of choice in this field. Chronic cerebrovascular disease (CVD) is another matter. Symptoms such as transient ischemic attacks (TIAs) are often caused by severe stenoses in the larger arteries feeding the brain. In most cases, the treatment will be conservative.

PET Imaging in Cerebrovascular Disease | Radiology Key

Many studies promote both diagnostic and prognostic roles for single photon emission computed tomography (SPECT) functional brain imaging in patients with cerebrovascular disease (CVD). SPECT allows in vivo non-invasive imaging and quantification of regional cerebral blood flow (rCBF). Main indications include stroke, transient cerebral ischaemia (TIA), intracranial haemorrhage and arteriovenous malformation (AVM).
