Wing 445.6 flutter was analysed through a strong coupling between the wing vibration and flow. The reduced flutter velocity was predicted and

results are in good agreement with the experimental data. It is found that the subsonic flutter is mainly induced by the flow separation and the transonic and supersonic flutter are mainly caused by the oscillating shock wave and its induced flow separation.

Current trends in turbomachinery design significantly reduce the mass ratio of structure to air, making them prone to flutter by aerodynamic coupling between mode shapes, also called coupled-mode flutter. The p-k method, which solves an aeroelastic eigenvalue problem for frequency and damping respectively excitation of the aerodynamically coupled system, was adapted for turbomachinery application using aerodynamic responses computed in the frequency domain.

The fluid-structure configurations investigated in the following are entirely characterized by four non-dimensional parameters: (1) $R_e = U \cdot L \cdot \nu^{-1}$

Theoretical analysis indicates that the flutter dynamic pressure Q_F and the flutter frequency f_F at the point of mass similarity are finally evaluated as (9) $Q_F^a = Q_F^m / N_F$ (10) $f_F^a = f_F^m / N_F$ where the superscripts a and m refer to the actual vehicle and the computational model with decreased stiffness, respectively, and N_F denotes the critical stiffness coefficient of flutter relative to the actual value.

In fluid-structure problems one can argue, that a fluid domain deformation $u(f)$ released through a boundary deformation $u_\Gamma(f)$ leads to a boundary force $f_\Gamma(f)$ and therefore a pseudo-structure formulation is introduced for the fluid problem: (13) $F_u \Gamma(f) = f_\Gamma(f)$.

Fluid-structure interaction is the interaction of some movable or deformable structure with an internal or surrounding fluid flow. Fluid-structure interactions can be stable or oscillatory. In oscillatory interactions, the strain induced in the solid structure causes it to move such that the source of strain is reduced, and the structure returns to its former state only for the process to repeat.
