Parametric Empirical Bayes Methods For

Empirical Bayes methods are procedures for statistical inference in which the prior distribution is estimated from the data. This approach stands in contrast to standard Bayesian methods, for which the prior distribution is fixed before any data are observed. Despite this difference in perspective, empirical Bayes may be viewed as an approximation to a fully Bayesian treatment of a hierarchical model wherein the parameters at the highest level of the hierarchy are set to their most likely values

In the broadest sense, the underlying goal of an empirical Bayes method is to use Bayesian methods without fully specifying the prior, either by estimating the prior or its parameters.

This chapter outlines parametric empirical Bayes confidence intervals. Empirical Bayes modeling assumes the distributions π for the parameters $\theta = (\theta_1, \dots, \theta_k)$ exist, with π taken from a known class Π of possible parameter distributions. Π is considered independent $N(u, A)$ distributions on $\mathbb{R}^k$. It is called parametric empirical Bayes problem, because $\pi \in \Pi$ is determined by the parameters (u, A) and so is a parametric family of distributions.

Empirical Bayes The constraints of slow mechanical computation molded classical statistics into a mathematically ingenious theory of sharply delimited scope. Emerging after the Second World War, electronic computation loosened the computational stranglehold, allowing a more expansive and useful statistical methodology.

The idea with empirical Bayesian methods is to use the Bayesian set-up but to estimate the priors from the population of all features. Formally speaking, empirical Bayes are frequentist methods which produce p-values and confidence intervals. However, because we have the empirical priors, we can also use some of the probabilistic ideas from Bayesian analysis. We will be using empirical Bayes methods for differential expression analysis. Empirical Bayes estimation for queueing systems and networks

Empirical Bayes methods are a collection of ways to estimate and update the parameters of a prior probability before creating a posterior probability distribution. This technique still follows the general Bayesian statistics model, but turns the process of estimating initial assumptions (prior probability) into a two-step procedure. Empirical Bayes estimation is used instead of the Maximum Entropy
