An embedded system can be thought of as a computer hardware system having software embedded in it. An embedded system can be an independent system or it can be a part of a large system. An embedded system is a microcontroller or microprocessor based system which is designed to perform a specific task. For example, a fire alarm is an embedded system; it will sense only smoke. An embedded system has three components – It has hardware. It has application software.

Embedded Systems - Overview - Tutorialspoint

A common array for very-high-volume embedded systems is the

system on a chip (SoC) that contains a complete system consisting of multiple processors, multipliers, caches and

interfaces on a single chip. SoCs can be implemented as an application-specific integrated circuit (ASIC) or using a field-programmable gate array (FPGA).
