Instance segmentation is an approach that identifies, for every pixel, a belonging instance of the object. It detects each distinct object of interest in the image. For example, when each person in a figure is segmented as an individual object. Thresholding. The simplest method of image segmentation is called the thresholding method. This method is based on a clip-level (or a threshold value) to turn a gray-scale image into a binary image.

Image segmentation - Wikipedia

The image segmentation method is a low-level image processing method to partition an image into homogeneous regions. No universal approach exists to support all image types, as this subjective method fails to detect uncertainty. The segmentation methods mainly depend on the application, with no uniformity for all color spaces.
