The acoustic transfer functions of external ears with or without headphones affect the features of perceived sounds and vary considerably with listeners and headphones. A method for estimating the frequency responses of external-ear transfer functions from the sound at the entrance of a blocked ear canal (or from the input of a headphone) to the sound at the eardrum for different listeners and headphones is developed based on an acoustic signal model of external ears.

In the modeling approach presented above many components are modeled using electro-acoustic parametrization. However, the transfer functions V_{em} / V_r and B_m / B_{em} are less suited for this kind of parametrization and measurements are usually required. Although this allows for a precise modeling, parametric modeling allows for a low number of parameters to describe these transfer functions efficiently.

function models of the system. Transfer function models differ from wave models in two key respects. First, whereas wave models are generally based on the response to harmonic inputs, transfer function models predict structural response in the time domain as well.
