Old and New Subsystems of Color Vision. Our own trichromatic color vision depends on two subsystems, a phylogenetically recent one overlaid on a much more ancient one. Most mammals are dichromatic, having only two types of cone receptor in the retina. For the main business of vision—the detection of movement and form—they rely on a single class of cone, with its peak sensitivity at long wavelengths (500–570 nm).

Color vision: Opsins and options - PubMed Central (PMC)

People with colour vision deficiency are unable to see colours clearly and accurately. They may find it difficult to distinguish between different colours. Colour vision deficiency is often called 'colour blindness'. However, actual colour blindness, where no colour seen at all, is rare. People with colour vision deficiency may have difficulty identifying pale colours or deep colours if the lighting is poor.

colour vision testing and employment, colour blindness ...

The process of color vision starts in the retina according to the Trichromatic Theory. This theory was developed by Thomas Young and Herman von Helmholtz, and thus it is also called the Young-Helmholtz theory. In the trichromatic theory, they proposed that the retina is comprised of three distinct types of cones or color-sensitive photoreceptors.

Color vision is an ability of animals to perceive differences between light composed of different wavelengths (i.e., different spectral power distributions) independently of light intensity. Color perception is a part of the larger visual system and is mediated by a complex process between neurons that begins with differential stimulation of different types of photoreceptors by light entering the eye. Those photoreceptors then emit outputs that are propagated through many layers of neurons and t

This is why people with normal color vision are known as trichromats. Normal color vision uses all three types of light cones correctly. The center of the macula (fovea) is responsible for the most acute color vision because it contains the highest concentration of cones. How Can People with Normal Color Vision See Other Colors? While there are three types of color cones, the cones can sense other colors.

What is Normal Color Vision? Find Out What You Can See

Color vision uses two properties of light to create visual contrasts. One property is effective energy, that is, the number of quanta in the light. The other is the frequency of vibration, or wavelength, of the absorbed quanta. How our brain separates these two properties of light and then recombines them to create color is the mystery of color vision.
