- Copper nitrate can be used to generate nitric acid by heating it until decomposition and passing the fumes directly into water. This method is similar to the last step in the Ostwald process. The equations are as follows: • $2\text{Cu}(\text{NO}_3)_2 \rightarrow 2\text{CuO} + 4\text{NO}_2(\text{g}) + \text{O}_2(\text{g})$ • $\text{NO}_2 + \text{H}_2\text{O} \rightarrow 2\text{HNO}_3 + \text{NO}(\text{g})$ • Copper nitrate soaked splints of wood burn with

Copper(I) chemistry is limited by a reaction which occurs involving simple copper(I) ions in solution. This is a good example of disproportionation - a reaction in which something oxidises and reduces itself. Copper(I) ions in solution disproportionate to give copper(II) ions and a precipitate of copper. The reaction is:

The objective of this lab was to fully carry out five reactions of copper, and to observe and understand the methods behind each reaction. The copper first underwent a redox reaction with nitric acid, resulting in a light blue fluid. Then, NaOH was added in

order to create a copper precipitate, creating a darker blue cooler.

Chemical Reactions of Copper Lab by Natalie Dickman

The Copper Lab demonstrates stoichiometry in chemistry. Stoichiometry is helpful in calculating the amount of an element or compound in chemical reactions. For the lab, stoichiometry was used to predict the amount of copper that would be left over. Using stoichiometry, the experimenter could find out that the product of the copper would have the same amount of copper as the original amount.

To test this law, copper can be put through a cycle to test if the same mass of copper is present at the end of the cycle. This copper cycle consists of six different reactions and four different types of reactions. The four types of reactions are oxidation/reduction, precipitation, decomposition, and acid/base neutralization.

Cycle B starts with a solution of copper (II) chloride, which is used to precipitate basic copper carbonate. This greenish-blue solid decomposes to black copper (II) oxide on heating. The black solid oxide rapidly dissolves in dilute hydrochloric acid to give the original solution in the cycle, copper (II) chloride.
