Process Dynamics Modeling And Control [PDF, EPUB EBOOK]

There are three important process

variables in a process control system. (1) Controlled variables (2) Manipulated variables (3) Disturbance variables. Feedback control system measures the controlled variable and compares the measured value with the desired value and then adjusts the manipulated variables for the control of the system accordingly.

Dynamic models are essential for understanding the system dynamics in open-loop (manual mode) or for closed-loop (automatic) control. These models are either derived from data (empirical) or from more fundamental relationships (first principles, physics-based) that rely on knowledge of the process. A combination of the two approaches is often used in practice where the form of the equations are developed from fundamental balance

equations and unknown or uncertain parameters are adjusted to ...

Dynamic Model Introduction - APMonitor

Offering a different approach to other textbooks in the area, this book is a comprehensive introduction to the subject divided in three broad parts. The first part deals with building physical models, the second part with developing empirical models and the final part discusses developing process control solutions. Theory is discussed where needed to ensure students have a full understanding ...
