Robust Control Of Inverted

Pendulum

The balancing control of inverted-pendulum systems typically aims to stabilise the upright position, which is unstable in open-loop. In this respect, optimal control, H-infinity control, and energy-shaping are among the most notable approaches. In particular, energy-shaping control aims to appropriately define the total energy of the closed-loop system enforcing a strict minimum at the desired equilibrium and relies on either Euler-Lagrange or Hamiltonian formulation.

Abstract: This paper will illustrate the application of constraint based Robust Generalized Dynamic Inversion (RGDI) control for balancing the Rotary Inverted Pendulum system. The proposed control law is established by hybridizing the equivalent control (conventional GDI) and the robust control. The equivalent control is constructed by formulating the

dynamical constraints, based on the attitude deviation functions of the rotary arm and the vertical pendulum.

The robust generalized dynamic inversion control is designed in two stages; in the first stage, constraint differential equations of the controlled state variables are prescribed, which encompasses the control objectives. To enforce the constraint dynamics, the equivalent control is realized by means of Moore–Penrose generalized inversion.
