Absolute rotary encoders output a uniquely coded numerical value at each shaft position. Depending on the design type, the measured value is recorded via the optical scanning of a transparent code disc (EVM58...) or via a magnetic sensing principle (ENA58IL...). The maximum resolution per revolution is 65,536 steps (16 bits).

Rotary encoders especially benefit from the cyclic nature of Gray codes, because the first and last values of the sequence differ by only one bit. The Gray Code to Integer instruction will directly convert a gray code number to an integer for devices having a resolution of 512 or 1024 counts per revolution.

A rotary encoder, also called a shaft encoder, is an electro-mechanical device that converts the angular position or motion of a shaft or axle to analog or digital output signals. There are two main types of rotary encoder: absolute and incremental. The output of an absolute encoder indicates the current shaft position, making it an angle transducer. The output of an incremental encoder provides information about the motion of the shaft, which typically is processed elsewhere into information su

Rotary Encoders are devices that convert a motion into an analogue or digital signal. These devices are electro-mechanical sensors that monitor the position of the shaft or axle and convert it into the signal readable for digital devices. Rotary Encoders are also known as shaft encoders. Rotary Encoders can be divided into 2 main types: · Absolute – Digital Absolute encoders produce a unique digital code for each angle of shaft.

Rotary encoders with integral bearing that are conceived for separate shaft coupling are designed with a solid shaft. The recommended coupling to the measured shaft compensates radial and axial tolerances. Angle encoders for separate shaft couplings permit higher shaft speeds. Rotary encoders without integral bearing operate without friction. The two components - the scanning head and the scale disk, drum, or tape - are adjusted to each other during assembly.

The absolute rotary encoder has a maximum resolution of 65,536 steps per revolution (16 Bit). The Multi-Turn version can detect up to 16,384 revolutions (14 Bit). Therefore the largest result- ing resolution is 30 Bit = 230= 1,073,741,824 steps. The standard Single-Turn version has 13 Bit, the standard Multi-Turn version 25 Bit.
