of Ionic Compounds

In the periodic table, elements in a column form analogous compounds because they have the same charge on their ions. The halogens all tend to gain one electron, giving their ions a characteristic charge of -1 . The alkali metals, on the other side of the periodic table, all readily lose one electron, so their ions possess a charge of $+1$. Charges are balanced in a compound with the number of alkali metal ions equal to the number of halogen ions; NaCl is such a compound.

CHAPTER 4

The IUPAC (International Union of Pure and Applied Chemistry) convention is used to assign names to chemical compounds. Scientists from around the world formed IUPAC because they recognized the need for standardization in chemistry. IUPAC sets the guidelines for how compounds are named. There are two main divisions of compounds.

Chemistry Naming Ions Study Guide Answer Key

Chemists use nomenclature rules to clearly name compounds. Ionic and molecular compounds

are named using somewhat-different methods. Binary ionic compounds typically consist of a metal and a nonmetal. The name of the metal is written first, followed by the name of the nonmetal with its ending changed to -ide.
