Forecasting Using Simple Exponential Smoothing

In Simple (aka Single) Exponential Smoothing, the forecasted value at time $i+1$ is based on the value at time i , and the forecasted value at time i (and so indirectly on all the previous time values). In particular, for some α where $0 \leq \alpha \leq 1$, for all $i >$

1, we define Note that we don't include time $i = 1$ in the calculations of MAE and MSE.

Simple exponential smoothing has a “flat” forecast function: $\hat{y}_{T+h|T} = \hat{y}_{T+1|T} = \ell_T$, $\forall h=2,3,\dots$. That is, all forecasts take the same value, equal to the last level component. Remember that these forecasts will only be suitable if the time series has no trend or seasonal component.

Simple Exponential Smoothing (SES) Let's model our time series as follows: $x(t) = f(t) + \text{noise}$ Here $f(t)$ is a deterministic

function of t , and noise is independently generated at each time step by sampling from a suitable distribution, e.g. standard normal.

Exponential Smoothing Approaches In Time Series Forecasting

Exponential Smoothing Forecasting Exponential smoothing is generally used to make short term forecasts, but longer-term forecasts using this technique can be quite unreliable. More recent observations given larger weights by exponential smoothing methods, and the weights decrease exponentially as the observations become more distant.

How to do a Sales Forecast in Excel with Exponential Smoothing

For simple exponential smoothing, there is only one smoothing parameter (α), but for the methods that follow there is usually more than one smoothing parameter. There are cases where the smoothing parameters may be chosen in a subjective manner — the forecaster specifies the value of the smoothing parameters

based on previous experience.

Exponential smoothing - Wikipedia

Alternatively, Simple exponential smoothing can also be expressed by: The new forecast is equal to the previous forecast, plus an adjustment, which is the smoothing constant α times the last forecast error (Actual - Forecast). In other words, we adjust the previous forecast by the fraction of the last forecast error to get the new forecast.
