Many microscopy techniques have been developed in life sciences to study biological organisms and their underlying

biochemical and molecular processes. Therefore, life science research can span many orders of magnitude in scale, from studying single molecules through to whole model organisms. A wide range of microscopy techniques are available for life science research.

Laser beam shaping for biomedical microscopy techniques

An important application of biomedical imaging involves microscopic visualization of cells, molecules and related biological samples. Confocal fluorescence microscopy has become a research standard for its ability to perform 3D reconstruction of fluorescently-labeled cellular structures, and it is ideal for cultured samples or thin-tissue sections, but is limited to a z-resolution, or distance between focal planes, in the order of one micron.

Microscopy has been applied to a number of spectroscopy techniques including IR, UV, VIS, and fluorescence spectroscopy that have been previously discussed. MSP is often referred to as "microspectroscopy" and involves concentrating the illuminating beam onto the sample through a microscope and then using another microscope objective to collect the radiation leaving the sample.
