Abstract. A new, scalable concept for diode-pumped high-power solid-state lasers is presented. The basic idea of our approach is a very thin laser crystal disc with one face mounted on a heat sink. This allows very high pump power densities without high temperature rises within the crystal. Together with a flat-top pump-beam profile this geometry leads to an almost homogeneous and one-dimensional heat flux perpendicular to the surface.

NEW HIGH-POWER, DIODE- PUMPED SOLID STATE LASER

A diode-pumped solid-state laser (DPSSL) is a solid-state laser made by pumping a solid gain medium, for example, a ruby or a neodymium-doped YAG crystal, with a laser diode . DPSSLs have advantages in compactness and efficiency over other types, and high power DPSSLs have replaced ion lasers and flashlamp-pumped lasers in many scientific applications, and are now appearing commonly in green and other color laser pointers .

Abstract. The new, scalable thin disc laser concept allows efficient diode-pumped high-power operation of solid state lasers with high beam quality. This concept is very useful to operate quasi-three level systems like Yb:YAG. The use of a very thin crystal disc with one face mounted on a heat sink together with the low heat generation of Yb:YAG (<11%) enables high pump power densities (> 5 kW/cm²) required for efficient operation without strong thermal degradation or optical distortion.

High-power diode-pumped Nd:GdVO₄/KGW Raman laser at 578 nm

The high predicted (up to 70%) optical-to-optical efficiency of the alkali laser, the superb (potentially 70% or better) wall-plug efficiency of the diode pumps, and the ability to exhaust heat at high temperature (100 C) combine to give a power-scalable architecture that is lightweight.
