Indeed, with p-phenylene-vinylene (PPV) polymers, different oligomeric structures have been investigated with the aim of differentiating between the relaxation decay processes; in conjugated organic polymers the decay to the ground state can take place through energy migration along the chain (in a ladder-type mechanism involving segments of gradually increasing conjugation), isomerization, or conformational relaxation into a more relaxed structure with subsequent decay to the ground state.

Several aspects of the photochemistry and photophysics of four main chain liquid crystalline polyesters with a rigid trans-stilbene 4,4'-dicarboxylate mesogen as chromophore and flexible spacer groups are reported. The three polymers with the longest 'spacer' groups are liquid crystalline at room temperature, two have smectic phases.
